

CHEKhub

FOR TELECOMMUNICATIONS

Chekhub provides a complete operational management platform for your telecommunications company. Chekhub ensures you have the tools needed to provide clarity, ensure precision, and increase efficiency in your operations.

Optimize Operations Within Your Telecommunications Company:

- Eliminate Manual Error
- Digital MOP's/SOP's
- Compliance Tracking
- Asset Lifecycle Management
- Preventative Maintenance
- Trend and Alert on Operator Rounds
- Manage Trouble Tickets
- Workforce Qualification Controls
- Manage SLA Compliance

Let us bring clarity to your organization. Set a definitive scope of work for your teams and people, by using a tool that defines the answers to these critical questions:

- Who is doing the work?
- What work is being done?
- When does the work need to be completed?
- Where is the work being done?

Eliminate manual error, by empowering your employees to complete high-priority tasks with precision and accuracy. Record, track, and trend data around assets/locations in real-time, which allows you to maintain and monitor systems so you can predict when failures will occur. Defining processes and procedures in advance, ensures that everyone knows exactly what to do if a situation that causes downtime arises.

Efficiency starts with being able to successfully measure, monitor, and track what's happening with your critical assets, at which facility, and where the data is tied to within the facility. The ability to have real time visibility into this data (from anywhere in the world) is the catalyst for implementing better maintenance practices, better repairs, help predict and reduce downtime, and ultimately drive better operations decisions.

Clarity.

Precision.

Efficiency.

TELECOMMUNICATIONS SOLUTIONS

Preventative Maintenance

Be proactive with your maintenance quality and compliance standards. Create checklists, schedule recurring maintenance events, and manage alerts and event escalations with ease. Utilize our CMMS module to simplify your maintenance routines. Minimize downtime, unplanned interruptions from breakdowns, and maximize asset life spans.

Operator Rounds

Streamline your daily rounds processes. Utilize digital checklists and asset information to ensure data is recorded with precision during walkthroughs. Pinpoint abnormalities and take corrective action within your critical facilities, plants, buildings, and job sites. Real-time alerting and trending of rounds data help ensure efficient operation of your facilities.

Asset Management

Manage the entire lifecycle of your locations and assets. Capture critical information of each asset and provide your stakeholders with comprehensive reports of work history, issues, and maintenance on all assets and locations. Analyze total cost of ownership from this data, and use performance metrics to support continuous improvement of asset activities.
